Section 1 : Coding

1. Problem Statement

Ravi is building a basic hash table to manage student roll numbers for quick lookup. He decides to use Linear Probing to handle collisions.

Implement a hash table using linear probing where:

The hash function is: index = roll_number % table_sizeOn collision, check subsequent indexes (i+1, i+2, ...) until an empty slot is found.

You need to:

Insert a list of n student roll numbers into the hash table.Print the final state of the hash table. If a slot is empty, print -1.

Input Format

The first line of the input contains two integers n and table_size, where n is the

number of roll numbers to be inserted, and table_size is the size of the hash table.

The second line contains n space-separated integers — the roll numbers to insert into the hash table.

Output Format

The output should print a single line with table_size space-separated integers representing the final state of the hash table after all insertions.

If any slot remains unoccupied, it should be represented as -1.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 4 7
50 700 76 85
Output: 700 50 85 -1 -1 -1 76

Answer

```c
#include <stdio.h>

#define MAX 100

void initializeTable(int table[], int table_size) {
    for (int i = 0; i < table_size; i++) {
        table[i] = -1;
    }
}

void insertIntoHashTable(int table[], int table_size, int arr[], int n) {
    for (int i = 0; i < n; i++) {
        int roll_number = arr[i];
        int index = roll_number % table_size;

        while (table[index] != -1) {
            index = (index + 1) % table_size;
        }
        table[index] = roll_number;
```

```c
        }
    }

    void printTable(int table[], int table_size) {
        for (int i = 0; i < table_size; i++) {
            printf("%d ", table[i]);
        }
        printf("\n");
    }

    int main() {
        int n, table_size;
        scanf("%d %d", &n, &table_size);

        int arr[MAX];
        int table[MAX];

        for (int i = 0; i < n; i++)
            scanf("%d", &arr[i]);

        initializeTable(table, table_size);
        insertIntoHashTable(table, table_size, arr, n);
        printTable(table, table_size);

        return 0;
    }
```
